Risk Assessment for Adults with Intellectual and Developmental Disabilities in Crisis

Introduction

This tool helps primary care providers determine whether a patient with intellectual and developmental disability who is experiencing an emotional or behavioral crisis can be managed safely in their current living or work environment or should be referred to the emergency department or possible crisis care options. It considers the risk to the patient and to others (e.g., peers, family, or support staff) during an escalation in the context of available supports. It helps identify unique risk and protective factors.

How to use this tool

Identify risk factors

When a patient with IDD and family/support persons present to the primary care clinician with concerns about an emotional or behavioral crisis, the first step is to determine how to keep the patient and others safe. See Initial Management of a Behavioral Crisis in Intellectual and Developmental Disabilities.

Use this tool to identify triggers or causes that result in harm by the patient to self (e.g., pain), others, or the environment, as well as harm to the patient from others (e.g., exploitation, abuse, neglect from peers, family, support staff or public).

Weigh risk factors against protective factors

Emotional and behavioral crises occur in the context of an imbalance between patient needs and supports (e.g., the environment and family/support persons, or other interpersonal resources). Therefore, consider patient context, environment-related, and interpersonal supports for a full risk assessment.

Take into account how the patient's IDD influences both risk and protective factors. Examples of protective factors for patients with mild IDD living independently include a sense of purposeful engagement in activities, meaningful and supportive connections with others, strong social supports, easy access to supports and interventions, restricted access to means of harm. Protective factors for adults with more severe IDD living in supported settings are mostly associated with the skills and resources of family/support persons, in particular their capacity to provide supports appropriate to the emotional developmental needs and to maintain a

calm, empathic demeanor during the person's dysregulated emotional states.

Consider the current context

Although some patients might already have a crisis management plan, such as <u>Crisis Prevention and Management Plan</u> and <u>My Coping Tool</u>, that describes their unique triggers and behavior management strategies, (re-) assess risk and protective factors in light of the current crisis and context.

Note any trauma history and treatment plan, recent life events, possible family/support persons burnout, or changes in risk and protective factors.

Provide safety first

If the risk assessment indicates that the patient cannot be managed safely in the current environment, discuss options and consider urgent assessment and management in an alternative setting (e.g., emergency department, crisis care). If the patient experiences repeated crises, a different crisis response may be needed (e.g., developmental disabilities crisis response service if available). Always follow up with the patient and family/support persons after an emergency department visit and re-assess risk and protective factors.

Based on the risk assessment, if you conclude that physical and psychological safety (i.e., people, including the patient, "feel safe") of the patient and those around them remain at risk, contact those at the appropriate level of authority who are ultimately responsible for the care of incapable adults (e.g., agency management, state or local government, ombudsman, police) to alert to a situation that is beyond the scope of family medicine for effective intervention.

Risk Assessment for Adults with IDD in Crisis

2. RISK AND PROTECTIVE FACTORS CHECKLIST

Consider the risk domains in this list and indicate when a factor is present (yes/no/unknown). Involve the patient as much as possible. Involve the patient's network of support if further information is needed. Consider the unique risk factors against protective factors and supports in the context of the patient's current crisis.

Suicide			
► Patient			
Communicates or shows behaviors about ending their life	Yes	No	Unknown
Feels hopeless and is unable to identify reasons to continue living	Yes	No	Unknown
Shows poor judgment or mental illness	Yes	No	Unknown
Has a history of suicidal or para-suicidal behaviors	Yes	No	Unknown
Family/support persons and environment			
Means are available for the person to end their life	Yes	No	Unknown
Family/support persons are able to supervise and protect the person	Yes	No	Unknown
Self-harm or Self-Injurious Behavior			
▶ Patient			
Verbalizes thoughts or intent to self-harm	Yes	No	Unknown
Engages in self-harm/self-injurious behavior (current state or evidence)	Yes	No	Unknown
Has known triggers to self-harm/self-injurious behavior	Yes	No	Unknown
Has a history of self-harming/self-injurious behavior	Yes	No	Unknown
Family/support persons and environment			
Means are available for the person to harm themselves	Yes	No	Unknown
Family/support persons are able to supervise and protect the person	Yes	No	Unknown
Prior triggers to self-harm/self-injurious behavior are present	Yes	No	Unknown
Self-care and neglect			
▶ Patient			
Does not engage in basic self-care	Yes	No	Unknown
Declines assistance with self-care	Yes	No	Unknown
Shows self-neglect and behaviors that put the person at risk	Yes	No	Unknown
Is unable to manage medical conditions and medications	Yes	No	Unknown
Family/support persons and environment			
Family/support persons are available and able to assist in personal care	Yes	No	Unknown
Family/support persons are available and able to assist in medical care	Yes	No	Unknown

Updated November 2023 iddtoolkit.org Page 2

Risk to others			
► Patient			
Communicates thoughts or intent to harm others (makes threats)	Yes	No	Unknown
Gestures about hurting others	Yes	No	Unknown
Has sufficient mobility and strength to potentially harm others	Yes	No	Unknown
Shows aggression and threatening behavior that escalates quickly or unpredictably	Yes	No	Unknown
Has a history of causing physical or emotional harm to others	Yes	No	Unknown
▶ Family/support persons and environment			
Family/support persons are able to recognize cues and to intervene safely	Yes	No	Unknown
There are vulnerable individuals in the setting who cannot protect themselves	Yes	No	Unknown
Safe support is possible in current setting without family/support persons being at risk of harm while trying to prevent harm to others	Yes	No	Unknown
Risk to environment			
▶ Patient			
Verbalizes thoughts or intent to damage property	Yes	No	Unknown
Engages in behavior(s) that could damage property	Yes	No	Unknown
Has mobility and strength to be able to cause damage	Yes	No	Unknown
Has a history of damage to environment in recent past	Yes	No	Unknown
Escalates quickly or unpredictably	Yes	No	Unknown
Family/support persons and environment			
Family/support persons are able to recognize an escalation and to intervene effectively	Yes	No	Unknown
Family/support persons feel comfortable about their ability to predict and prevent risks to the environment	Yes	No	Unknown
Family/support persons are able to provide a safe and supportive environment (e.g., de-escalate the patient's dysregulated emotional state by maintaining a calm demeanor and encouraging calming responses)	Yes	No	Unknown
Victimization or exploitation			
► Patient			
Shows signs of possibly being victimized or exploited	Yes	No	Unknown
Does not ask for help	Yes		
		No	Unknown
Lacks insight into possible dangers of the situation	Yes	No No	Unknown Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited	Yes	No	Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited Family/support persons and environment	Yes Yes	No No	Unknown Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited	Yes Yes	No No	Unknown Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited Family/support persons and environment Family/support persons are present, recognize the person's vulnerabilities, and able to supervise and protect the patient Stress, trauma behaviors, and triggers	Yes Yes Yes	No No	Unknown Unknown Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited Family/support persons and environment Family/support persons are present, recognize the person's vulnerabilities, and able to supervise and protect the patient Stress, trauma behaviors, and triggers Patient	Yes Yes Yes	No No	Unknown Unknown Unknown
Lacks insight into possible dangers of the situation Is vulnerable and does not protect self emotionally or physically Has a history of being victimized or exploited Family/support persons and environment Family/support persons are present, recognize the person's vulnerabilities, and able to supervise and protect the patient Stress, trauma behaviors, and triggers Patient Shows signs of sympathetic nervous system (SNS) mobilization: hyperarousal, hypervigilance, easily triggered into sympathetic survival responses of "fight" (e.g., verbal or physical aggression, self-injury), "flight" (e.g., running away, avoiding, withdrawing), "freeze"	Yes Yes Yes	No No	Unknown Unknown Unknown
