

Vanderbilt Auditory Development Lab

Department of Hearing & Speech Sciences

Help us find out how
babies with hearing
loss learn from auditory
and visual cues!

The Auditory Development Lab at Vanderbilt University is recruiting infants with hearing loss, from ages 12 to 24 months, to participate in a research study that examines how visual and auditory cues help infants learn about objects.

This study will involve one visit to our playroom for 30 minutes. Your child will be asked to play with some toys that will provide auditory and visual reinforcement. During your visit, we provide a T-shirt, toy or book, as well as \$20 to thank you for participating!
