

Researchers at Vanderbilt are conducting a study to learn more about the brain function of females with Rett Syndrome and how it compares to the brain function of typically developing females. We hope that this information can be used to measure effectiveness of future treatments for Rett syndrome.

Who can participate?

Females ages 1-18 with Rett syndrome

What does the study involve?

If you agree to have your child participate in our study she will be asked to:

- Have an EEG to measure brain activity
- Receive an Evoked Potential measurement – this is a **non-invasive** procedure similar to an **EEG**.
- Undergo a routine clinical assessment.
- Complete scheduled follow up visits

All participants are compensated for their time and travel.

If you are interested in learning more or participating, contact us at
