Principles of Explicit Instruction for Distance Learning

TIPS AND RESOURCES FOR CAREGIVERS

The text *Explicit Instruction* by Anita L. Archer and Charles A. Hughes outlines a systematic and engaging instructional delivery method called explicit instruction which is appropriate for all children, including those who may be struggling or who may have a disability. Explicit instruction is useful across many of subjects and grade levels. To read the first chapter of the book free of charge, click here.

The following elements may be helpful to incorporate in a distance learning scenario.

- **Begin lessons with a clear statement of the lesson’s goals and your expectations.** When starting a new lesson or activity, tell the learner what he or she will learn and why this is important.

  **Example**
  This math activity helps you practice addition facts. This is important because we add all the time in life, like at the grocery store or in restaurants or when playing games.

**Distance Learning Suggestions**
- State the goal of the lesson or activity for your child and have him or her repeat some or all of it.
- Label worksheets with the goal for your child.
- Talk about ways in which the skill your child is practicing will be useful in other parts of life (sports, chores, activities with friends, etc.)
- If teachers have provided you with activities for your child to do at home, ask them to share the lesson goal or activity with you as well.

Provide step-by-step demonstrations.
Model exactly how to do a skill or strategy for a learner by showing them the steps to complete the work and describing why you are doing what you are doing.

Example
When teaching a learner how to draw an array for multiplication, describe how to set up the array and why you are doing that. “The multiplication problem is $4 \times 3$. So I am going to start by drawing 4 dots going across the page. That is the 4 in the multiplication problem. Then I will make 3 dots down. That represents the 3 in the problem. Then I will fill in the rest of the dots and count how many there are. I see that is 12. That shows what $4 \times 3$ is, or 4 rows of 3.”

Distance Learning Suggestions
- When showing your children how to do an activity or reading aloud, ask them questions to keep them engaged.
- If you are watching an educational video with children, pause the video every so often to ask questions about what is happening.
- If teachers have provided you with activities to do with your children at home, ask them to give you 2-3 questions to prompt your children with while they are doing the activity.

Help students organize knowledge.
Learners can often have difficulty organizing and connecting information they learn from one day to the next. Try using graphic organizers to help learners organize newly learned information consistently.

Example
When reading aloud, have the student repeat the last word you read while you point to it; when explaining the steps of a process you are teaching, pause and have students answer questions to previously learned information or repeat back the new information.

Require frequent responses.
Encourage the learner to engage with the teacher/instructor frequently to maximize attention. Use methods like oral responses, written responses, or action response to check for student understanding.

Example
When reading aloud, have the student repeat the last word you read while you point to it; when explaining the steps of a process you are teaching, pause and have students answer questions to previously learned information or repeat back the new information.

Distance Learning Suggestions
• When showing your children how to do an activity or reading aloud, ask them questions to keep them engaged.
• If you are watching an educational video with children, pause the video every so often to ask questions about what is happening.
• If teachers have provided you with activities to do with your children at home, ask them to give you 2-3 questions to prompt your children with while they are doing the activity.
